

# Travel Insights

## Introduction

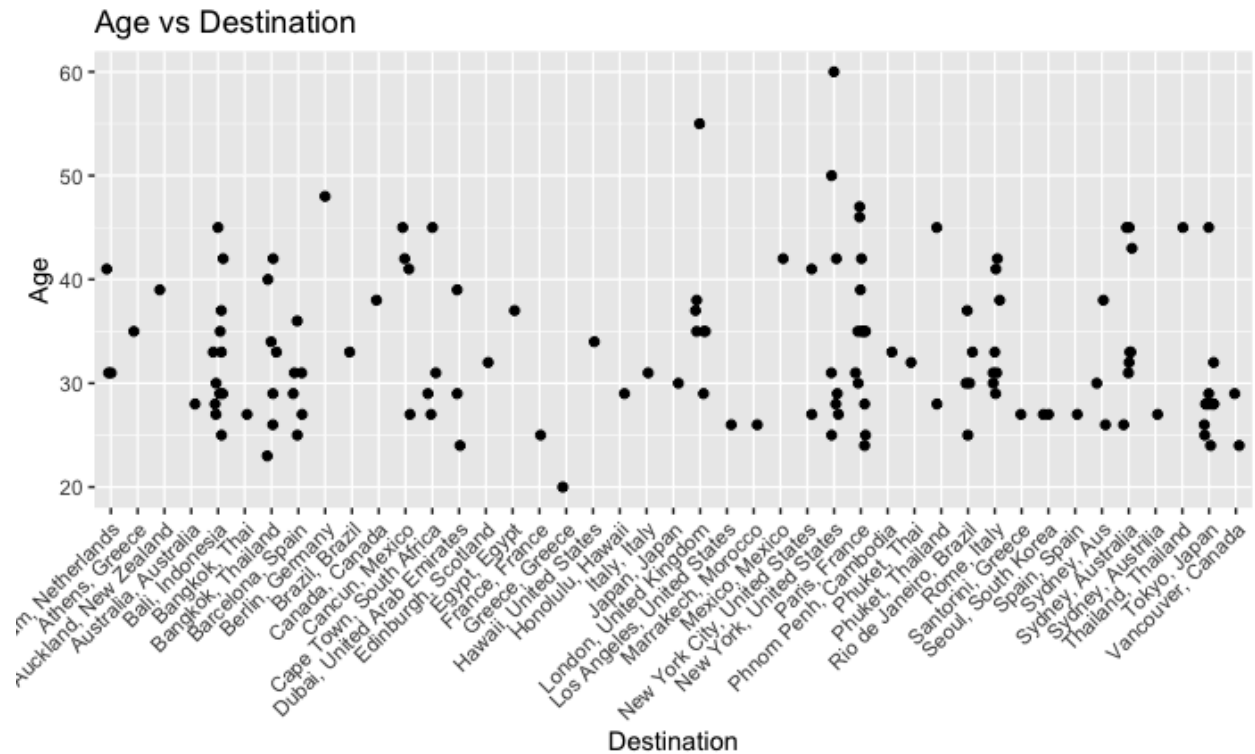

The following visualizations provide insights in various aspects of planning a trip/ vacation such as traveler demographics, accommodation and transportation preferences and costs. By using R for data manipulation and visualizations, we can help travel agents, families etc plan exciting vacations.

## Plots

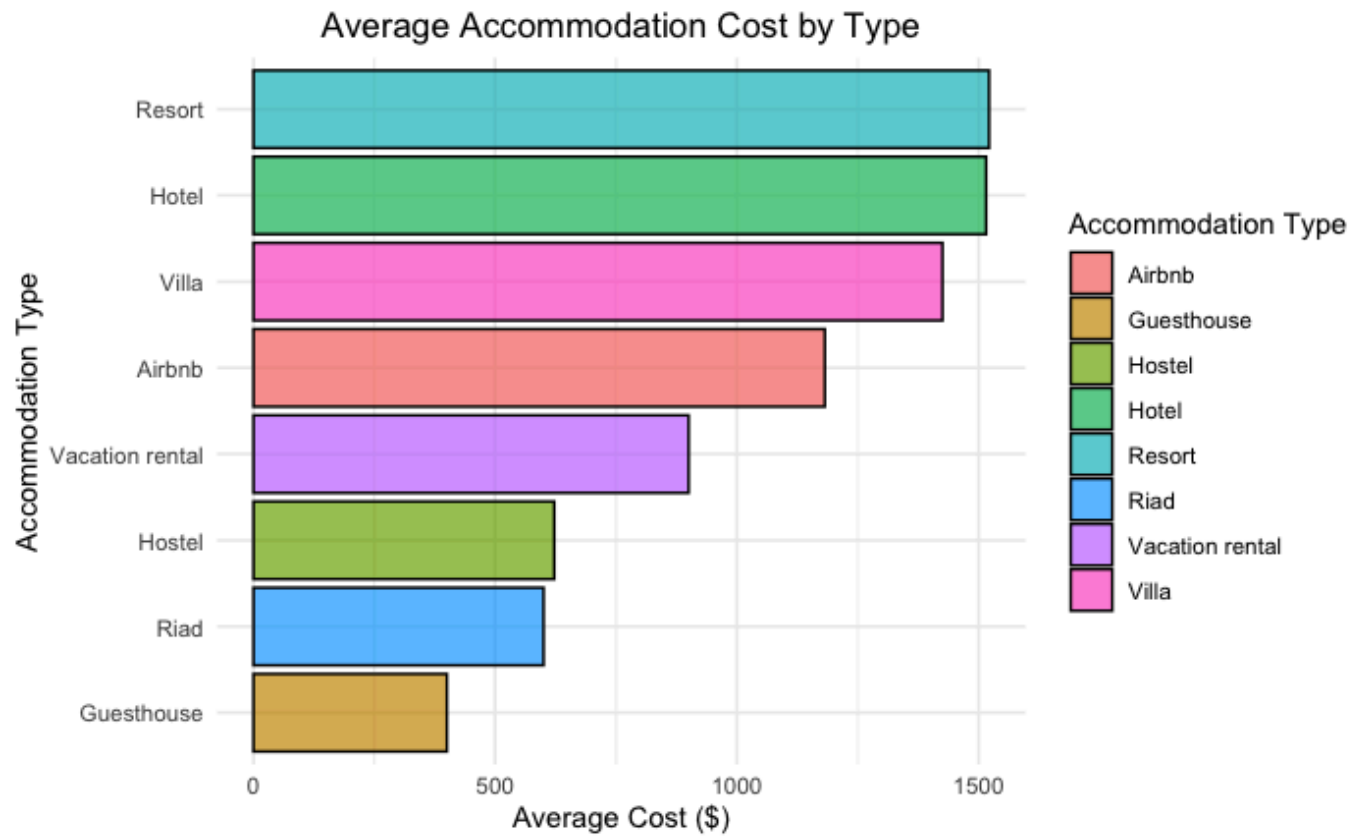

1. **Country Visits:** This bar chart shows the number of times each destination was visited within the data provided.. This visualization helps identify the most popular destinations; it can be used by travel agents and families to figure out where they can go on vacation and tourism agencies to know where their country stacks up when compared to others.

2. Age vs Destination: This scatter plot represents the age distribution of the travelers across various destinations. This visualization is useful as it shows which destinations are popular among certain age groups. This is beneficial as planners can have an idea on where to go based on age groups.

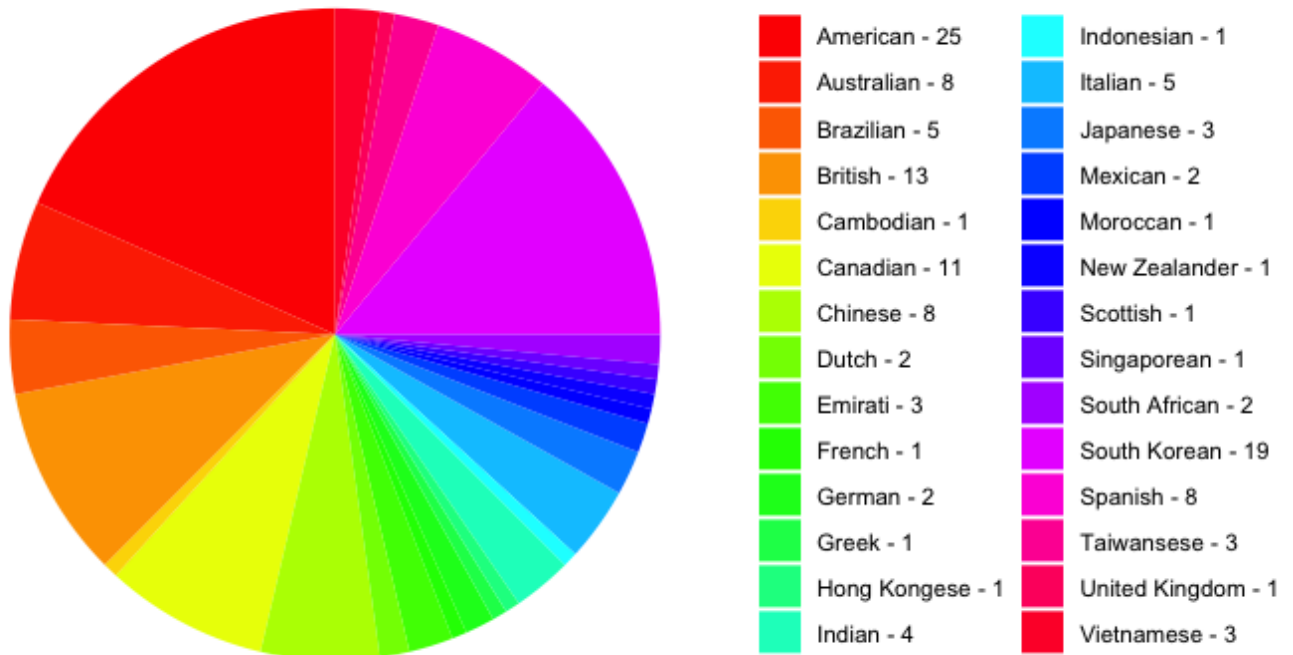

3. Accommodation Cost by Type: This bar chart shows the average cost of different types of accommodations worldwide. This is useful as planners can suggest different accommodations based on their budgets.

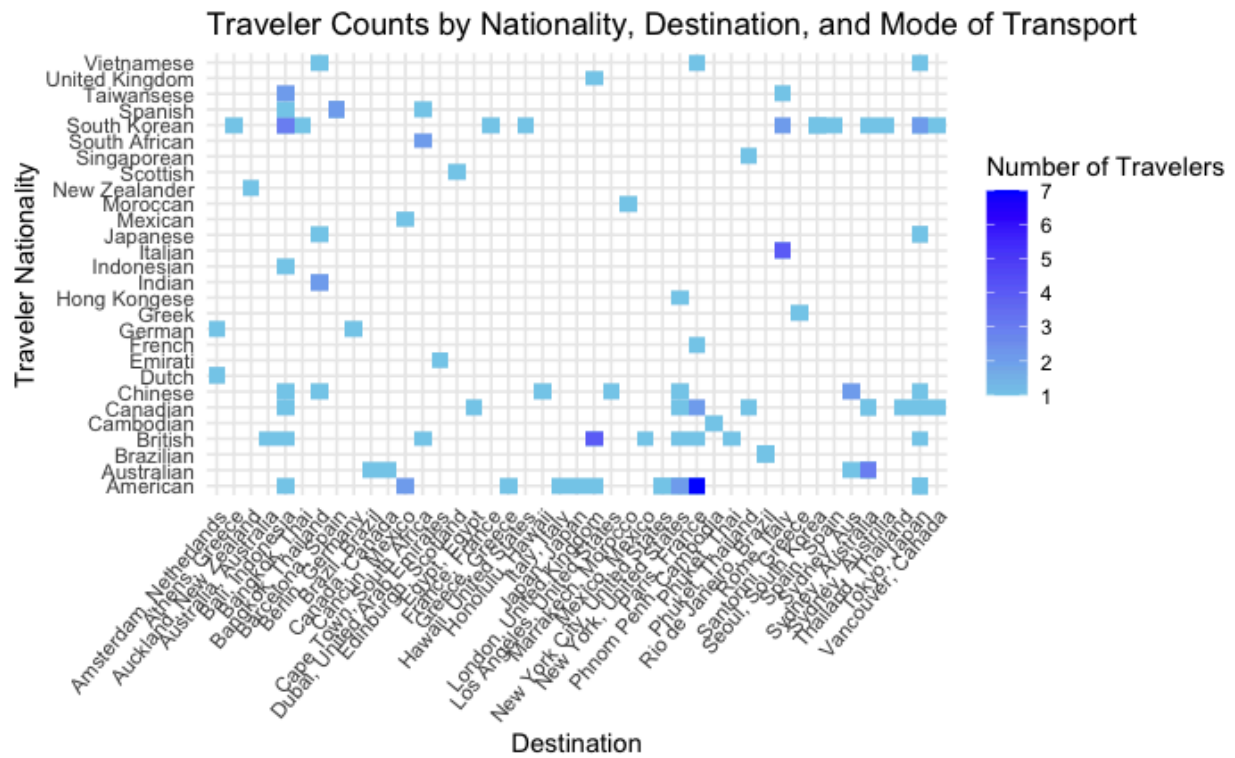

4. Traveler Nationality: The pie chart shows the different nationalities after the data was cleaned and normalized. This pie chart gives us an insight as to which nationality travels the most. This could be beneficial to tourism boards who want to increase tourism to their countries.

Nationality Distribution of Travelers

5. **Traveler Count by Nationality, Destination and Mode of Transportation:** This heat map depicts the number of travelers grouped by nationality, destination and how they got to their destination. This information is relevant as it was how different people got their destinations, helping planners finalize vacation plans.

## Conclusion

The visualizations created help provide valuable insight to travel patterns within a dataset, ranging from traveling trends among age groups, to accommodation costs and transportation preferences. The trends found from these visualizations can be applied to various parts of the travel industries to enhance planning and customer experiences.
